- The HighHay Team

Important : Pictures and videos are not part of the purchase. They are for demo purpose only. Credits are attributed to Unsplash.com pictures owners (free to use both in commercial and free product). Videos loop background can be found on youtube.com

How to use it?

Text and Logo Customization

The HTML files (index.html, index_layout_style2.html ...) themselves was made to be well documented (just follow comments inside) but if you need more help, here are some tips:

- **LOGO** : Replace the sample logo (logo_small.png file inside /img/picts/ folder)by yours, or change the following tag (there are two of it) to indicate the emplacement of your own logo:

```
<img class='logo' src='img/picts/logo_small.png'>
```
- **SOCIAL NETWORK LINKS** : They are placed inside `<div class='social-links columns'>` element (there are two of it) , in `<div class='align-center desc socialnet'>` tag. For customization:
 - o For links: Replace href content of the a tag by your links.
 - o For icons, since this template uses fontawesome icons. Just change the class name (fa-
iconname) of the `<i class='fa fa-iconname'></i>` tag to what you want. Check their website for more information (<http://fontawesome.io>).

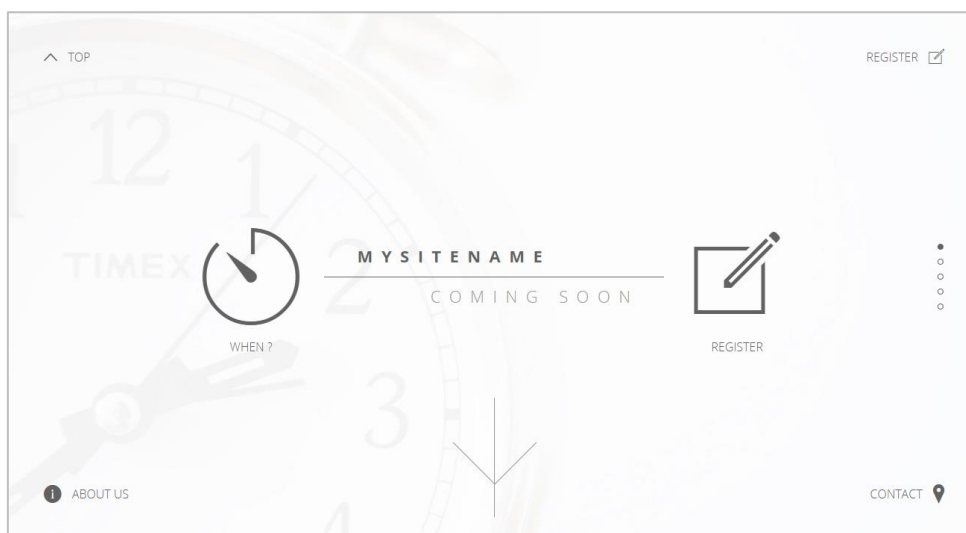

Clock Configuration :

Configurations are placed as data-... attributes inside `<div class='site-config'></div>` tag. The sample index.html file shows an example of customization.

Countdown Clock

To customize the countdown clock, add or change these attributes:

- **data-date** : attribute that indicates the launching date (Format: MM/DD/YYYY HH:MN:SC).
- **data-date-timezone** : attribute that indicates the launching date timezone. 0 UTC is the default value.

Static video as background

To use static video as background, add or change the following elements in your html file:

```
<div id="container" class="video-container show-for-medium-up">
```

```

<video autoplay="autoplay" loop="loop" autobuffer="autobuffer" muted="muted"
width="640" height="360">
  <source src="vid/loop-bg.webm" type="video/webm">
  <source src="vid/loop-bg.mp4" type="video/mp4">
</video>
</div>

```

Video should be available in **webm** and **mp4** format to support multiple browser.

If you do not want video as background, just remove this group of elements.

Email Subscription AJAX Server

Client side

The JavaScript file "*form_script.js*" handles the client side. You are free to customize it to your need.

Server side

Samples php-based AJAX server is provided under *ajaxserver* folder : *server.php*, *serverfile.php* and *servermailchimp.php* file. These server handles messages and email subscription requests made by users.

The sample code inside *server.php* file

- sends email to your desired email address (replace [your@email.com](#) by yours. Important: there are two of it since message recipient and email subscription recipient could be different)

The sample code inside *serverfile.php* f

- Write emails in a file called *email.txt* in the same folder as the server (*ajaxserver* folder by default)

The sample code inside *servermailchimp.php* file use mailchimp API to send the email to a mailchimp list :

Mailchimp subscription list

IMPORTANT : You need a mailchimp API Key and a mailchimp List to make it working

- If you do not have an api Key, create one here <http://admin.mailchimp.com/account/api/>
- Create also a Mailchimp mailing list here <http://admin.mailchimp.com/lists/> and click the "settings" link for the list - the Unique Id is at the bottom of that page.

To do so, first, you have to point your subscription server to the mailchimp server "*servermailchimp.php*".

Inside `<div class='site-config'></div>` , edit `data-subscription-server` such as:

```

<div class='site-config'>
  ...
  data-subscription-server = './ajaxserver/servermailchimp.php'
  ...
</div>

```

Then edit the *servermailchimp.php*, go to function `storeAddress($user_email)`, find the following lines and replace '`your_apikey`' by your Mailchimp API Key.

```

// grab an API Key from http://admin.mailchimp.com/account/api/
$api = new MCAPI('your_apikey');

```

Replace also `my_list_unique_id` of the following lines by your Mailchimp List Unique ID:

```

// grab your List's Unique Id by going to http://admin.mailchimp.com/lists/
// Click the "settings" link for the list - the Unique Id is at the bottom of
that page.

```

```
$list_id = "my_list_unique_id";
```
